

DOCUMENTATION

Please contact me via email: gabrielaguiarprod@gmail.com if any doubts or any problem emerges.

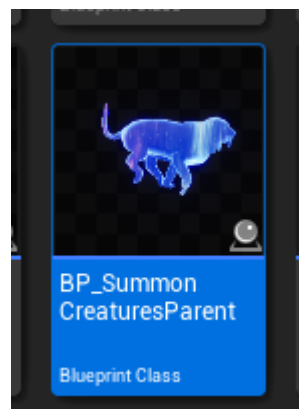

Thank you for acquiring this package, enjoy it!

HOW IT WORKS

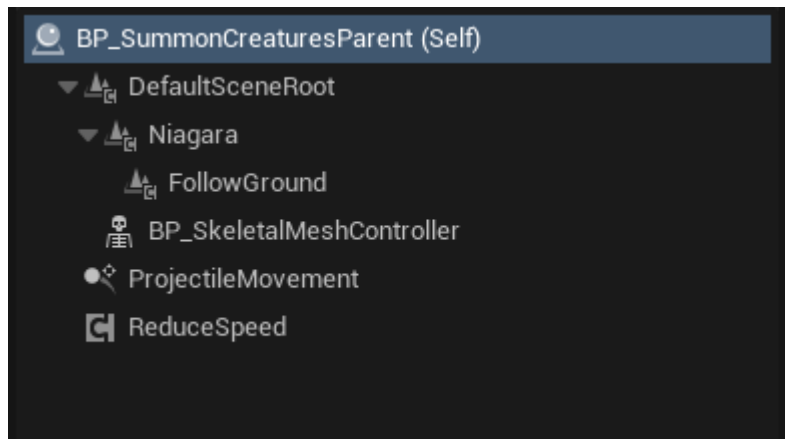

1) There's a BP_GAP_SpawnVFX with options to create a HUD, to choose the fire point and the list of the creatures to spawn.

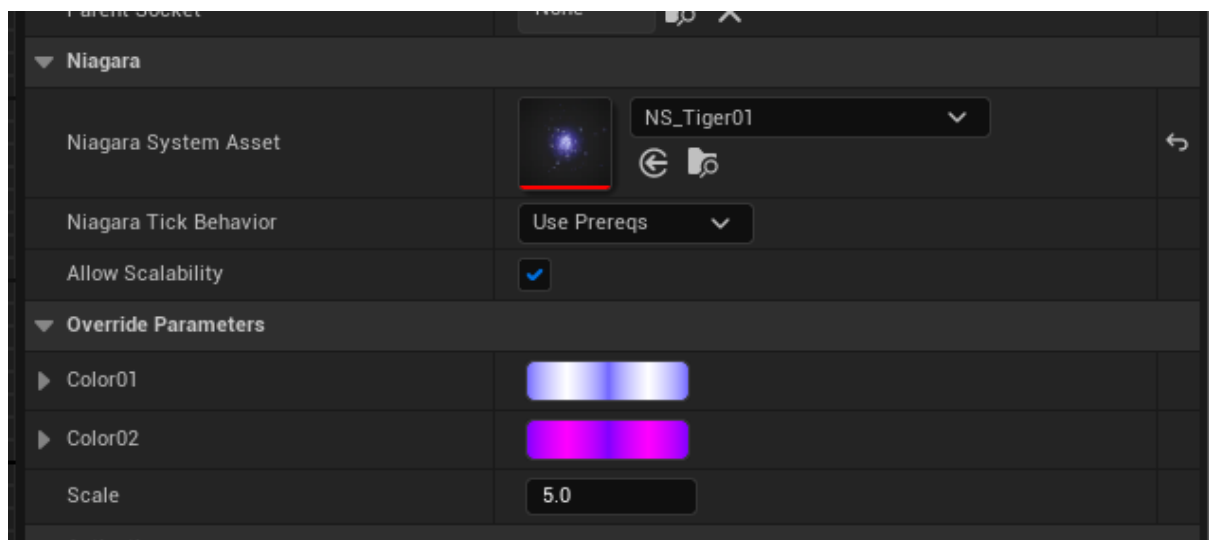

2) It spawns an instance of BP_SummonCreaturesParent

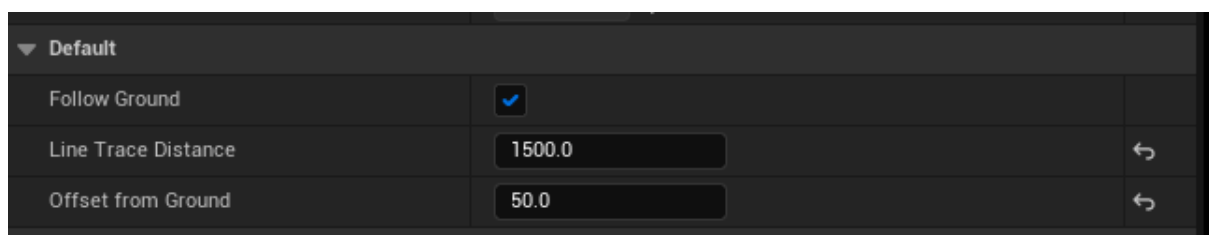

3) That blueprint contains all the functionality for the creatures to “walk” and follow ground. Contains the following components, Niagara, FollowGround, BP_SkeletalMeshController, Projectile Movement and Reduce Speed.

4) Niagara is used for Trails and Particle Effects.

5) Follow Ground will help the creature snap to the ground.

6) The BP_SkeletalMeshController is used to choose which creature model to use, to play the animation, to select the material (*preferably with erosion*), and erode the creature.

▼ Animation		
Disable Post Process Blueprint	☐	
Animation Mode	Use Animation Asset ▼	↶
Anim to Play	 AS_TigerRUN ▼	↶
Looping	☒	
Playing	☒	
Initial Position	0.0	
▶ Advanced		
▼ Mesh		
Skeletal Mesh	 SKM_TigerRUN ▼	↶
Skin Cache Usage	0 Array elements	+ 🗑
▼ Materials		
Element 0	 Mi_FresnelGalaxy01 ▼	↶
▼ Default		
Delay to Erode	0.6	↶
Delay to Destroy	3.0	
Erode Target	4.0	↶
Erode Rate	0.1	↶
Refresh Rate	0.025	↶
Eroding	☒	
Current Erosion	0.0	
▼ Component Tick		

7) Projectile Movement is an Unreal component that pushes the creature forward with a certain speed.

▼ Projectile		
Initial Speed	4000.0	↶
Max Speed	4000.0	↶
Rotation Follows Velocity	☐	
Rotation Remains Vertical	☐	
Initial Velocity in Local Space	☒	
Projectile Gravity Scale	1.0	

8) Reduce Speed can be used to slow down the creature near the end of its lifetime.

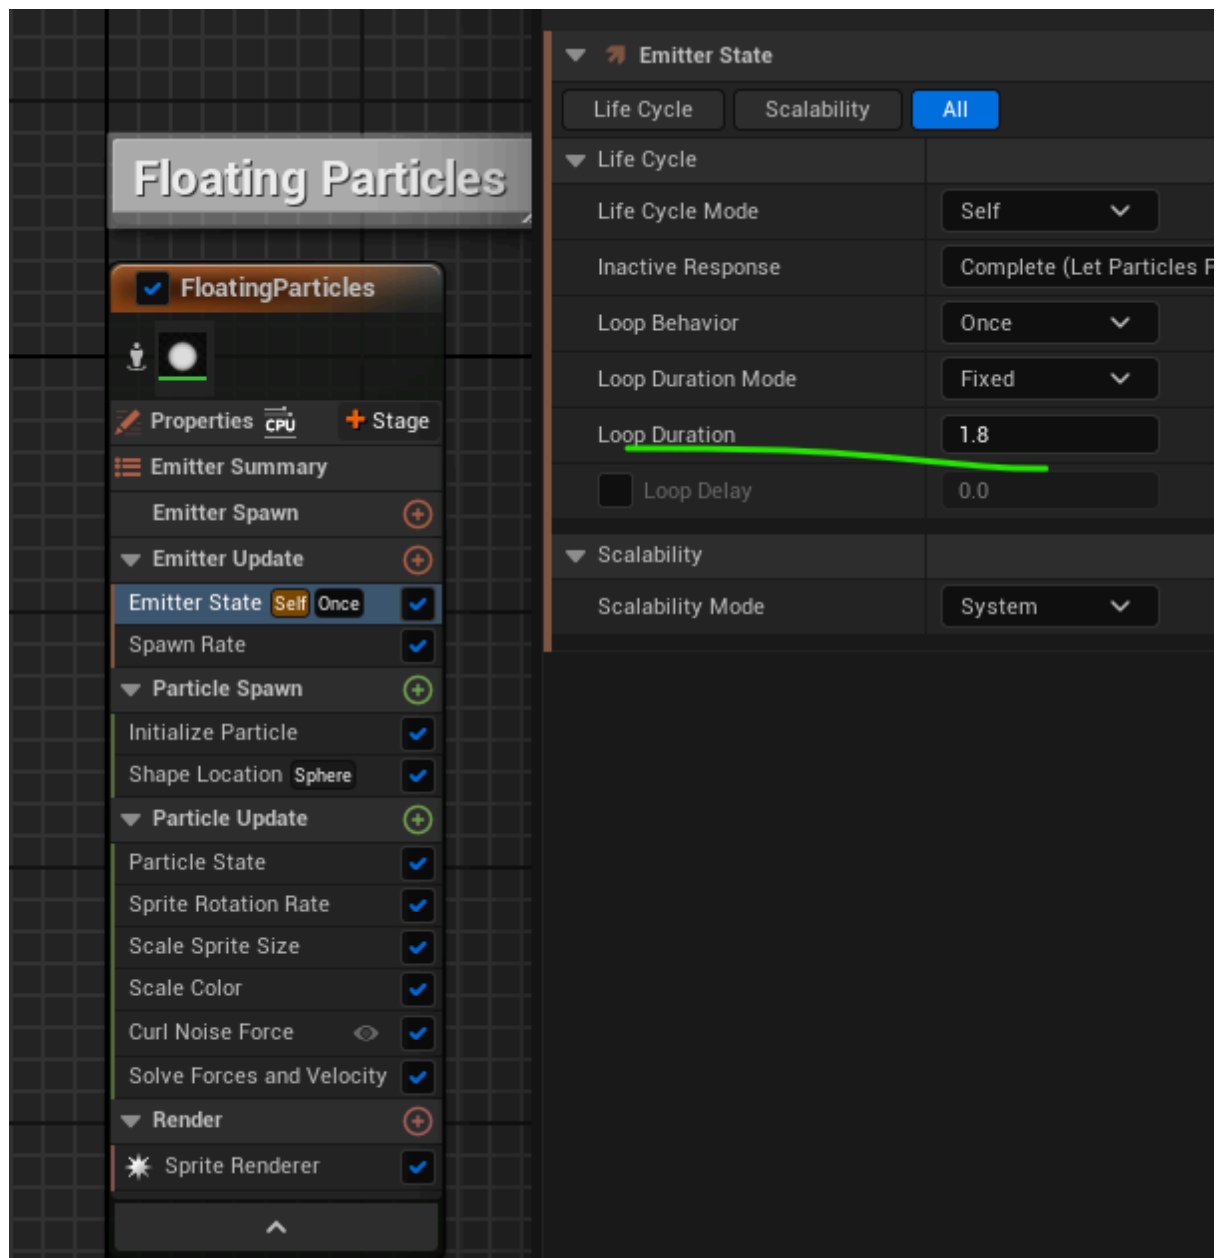

▼ Default		
Delay	0.8	↶
Reduce Speed	☐	
Reduce Speed Rate	3.5	↶
Projectile Movement	None None ▼ ↶ ↷	

9) In conclusion the effect works well if all things are timed well. When Niagara, BP_SkeletalMeshController and ReduceSpeed are working together and have matching timings.

ADJUSTING TIMINGS

If the creatures need to live for shorter or longer periods, the Niagara System, the emitters inside need to be adjusted.

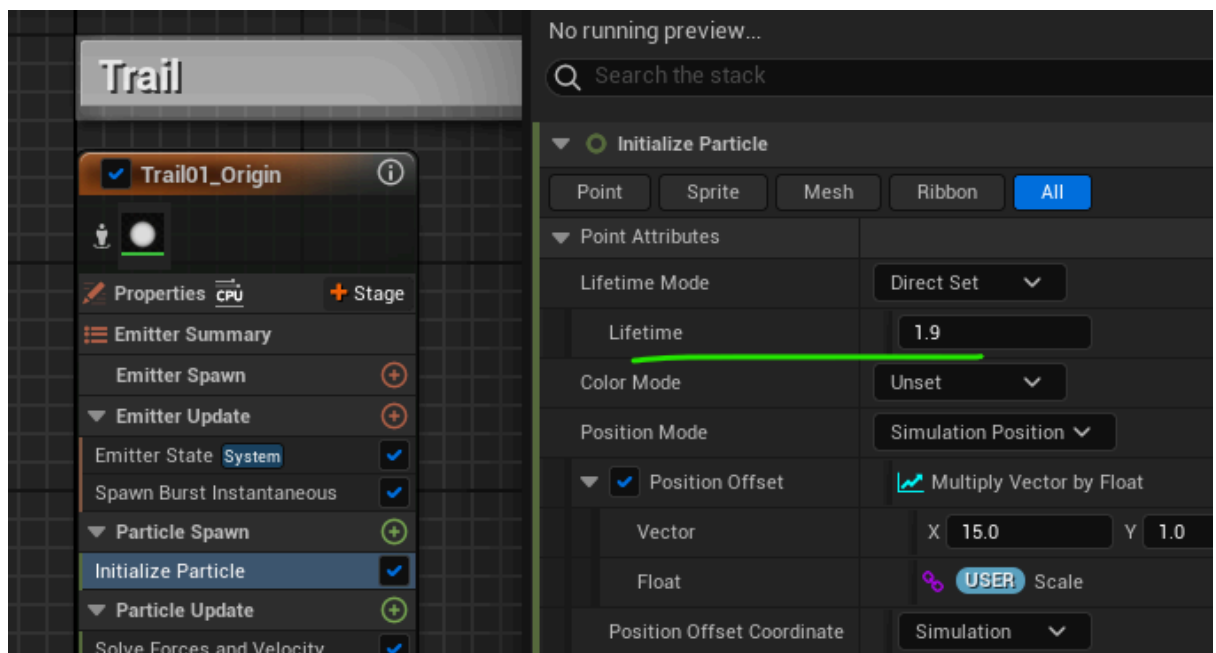

1) Floating Particles, for example, need a different Loop Duration.

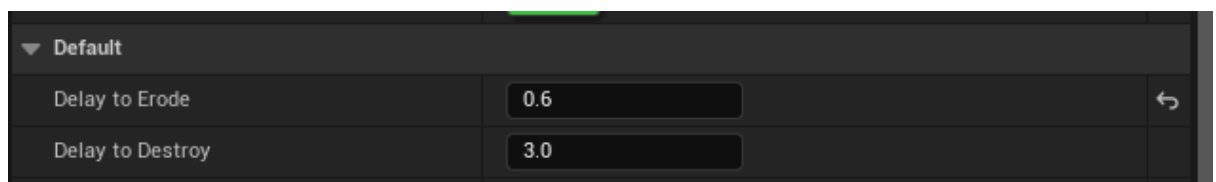

2) Impact and Shockwave need a different Loop Delay.

3) And to adjust all the trails only the Trail Origin needs adjustments, more specifically the Lifetime in Initialize Particle.

4) Adjustments to the BP Skeletal Mesh Controller are also necessary, like the delay to begin eroding and the delay to destroy the creature.

5) The Erode Target is how much to Erode, between 4 and 6 fully erodes the mesh normally. Erode Rate is how much it erodes every Refresh Rate. Normally you don't need to adjust this if your concern is making the creature live longer or less.

Erode Target	4.0	↩
Erode Rate	0.1	↩
Refresh Rate	0.025	↩

6) And finally, if you are trying to change how much it lives, if you are using Reduce Speed, you might also need to adjust its delay.

Delay	0.8	↩
Reduce Speed	☐	
Reduce Speed Rate	3.5	↩

DEMO SCENE - SHORTCUTS

T - Next Effect

R - Previous Effect

F - Shoot

NOTES

- 1) If this package has any blueprint, then it's used for DEMONSTRATION purposes. They probably aren't perfect, since the focus is Visual Effects / Niagara. You can use them but I recommend creating your own.
- 2) I can help with Visual Effects but not with your code. I recommend everyone to eventually create their own code/blueprints for their own projects.
- 3) Please contact me via email if any doubts or any problem emerges (check my profile in the Unity Asset store);
- 4) This asset is made and owned by Gabriel Aguiar Prod.
- 5) Any given credit is very much appreciated, such as:
'Visual Effects Artist - Gabriel Aguiar' or 'VFX Artist - Gabriel Aguiar'
